

## How to use database and backend code

### **Database**

- 1)Open mysql workbench
- 2) click on server
- 3)data import
- 4) click on the "import from self contained file"
- It will give the option to choose file : select "workflow.sql"
- 5) set default target schema as "workflow"
- 6) click on start import

### **backend**

- 1)open command prompt in directory where app.js is present
  - 2)type : npm install
- This command will install all the node modules required

Now go to connection folder

Click on connection.js file

Change password to your database password and database name if required

- 4)to run backend
- type "node app.js" on command prompt
